Poster Presentation Notes

Cloud Forensics Challenges in Bangladesh

Poster file: *Cloud_Forensics_Bangladesh_Poster_A1.pdf*. Point to each box as you speak.

Two versions in one script. The full script below runs about 3 minutes (about 440 spoken words). For the 2-minute slot, skip the parts marked **[can skip]**; the rest is about 270 words. The time shown for each part is for the full version.

Talk, in poster order

1. Opening (15 s, title banner). "My topic is cloud forensics in Bangladesh. When a crime involves cloud data, police must find it, prove it is genuine, and sometimes get it from a company abroad. I asked what the newest laws give investigators, and what is still missing."

2. The problem (20 s, left column, top box). "It is hard for three reasons. Logs expire: AWS keeps only 90 days of event history by default. Courts want proof, through a Section 65B certificate. And data may sit abroad, where a treaty request takes 6 weeks to 10 months."

3. Method (15 s, left column, funnel). "I followed PRISMA 2020. From 782 records I kept 15 studies. I also read the laws themselves on the government law portal."

4. The law (35 s, middle column). "The laws changed fast. The 2023 cyber law was replaced by an ordinance in 2025, then by Act 81 in April 2026, and the data protection ordinance was replaced by Act 63. Investigators have a 90-day hold order that can reach 180 days, a duty on providers to help, a warrant for traffic data, and a rule that forensic evidence counts. But these powers were already in the 2023 Act, written for ordinary computers. Still missing: a clear way to reach foreign cloud firms, a model 65B certificate for cloud records, and cloud forensic rules. The law allows those rules, but I found none issued."

5. A simple example (60 s, middle column, then point to the roadmap). **[can skip]**
"Here is an invented example from the paper. A company in Dhaka reports a fraud on day zero. The first suspicious login was 70 days earlier, and the provider keeps logs for 90 days by default, so its window is almost closed. The investigator asks for a preservation order. The company exports its own logs and records a hash, and a responsible official signs a 65B certificate for that export. The tribunal can then extend the hold up to 180 days, while a treaty request goes to the provider in parallel. The company's own copy saves the case. If the complaint had come on day 100, the provider's logs would be gone. Two steps still depend on open points: whether the order can bind a foreign provider, and who signs the certificate for cloud records."

6. Roadmap (25 s, right column). "For each of the five challenges I pair one legal step with one tool. For example, for short-lived data: preserve on day one and use log triage. The tools come from other countries' studies, so this is a proposal, not tested in Bangladesh."

7. Next steps and close (35 s, right column, then banner).
Full version: "My next steps are to say how section 36 orders reach foreign providers, publish a model 65B certificate, use section 49(2) to write cloud rules, and ask public bodies to copy key logs to storage they control. Bangladesh has the powers. The gap is reaching and handling cloud data, so the next rules should focus there. Thank you."
2-minute version: "Bangladesh has the powers. The gap is reaching and handling cloud data, so the next rules should focus there. Thank you."

Questions: keep each answer under 20 seconds

- **Why only 15 studies?** I used open-access work only, so every claim can be checked. One reviewer coded them, and the paper states this as a limit.
- **Are the AI results proven here?** No. They come from the authors' own tests elsewhere, and my roadmap is a proposal with a pilot plan.

- **Does AI evidence go to court?** No. AI gives a lead to a human analyst. Court sees the original log, its hash and the certificate.
- **What is new in your work?** It lines up the global cloud challenges against Bangladesh's 2025–26 law texts, which I read directly.
- **Is it legal advice?** No. It is my reading of the Bengali texts, and a lawyer should check it.
- **Why does the dropped local-copy rule matter?** It would have given police a local source for restricted data. Without it, provider cooperation matters more.
- **Why is 65B unclear for cloud?** Section 65B(4) asks for a certificate from a responsible official. For cloud, only the provider can say how logs are made and stored, so an account holder's certificate may not be enough. This is my reading, untested before the tribunal.
- **How would you test the roadmap?** A pilot on closed cases, comparing each tool with a trained analyst on time to a preservation order, exhibits accepted with certificates, days to first provider reply, and analyst hours saved.

Tips

- Practise once with a timer. Slot is 2 minutes: use the short version. If you get 3 minutes, use the full version.
- Say numbers slowly: 782, then 15.
- Say "proposed" about the roadmap, never "proven".
- If you do not know an answer, say what the paper does cover and that you will check the rest.
